Automated Feedback Analysis Workflow

Swetha Chennuru

Introduction

Goal:

The goal of this project is to automate the collection and analysis of customer feedback so insights can be acted on quickly and consistently without manual effort.

Tools Used:

Google Forms is used to collect customer feedback, Make is used to automate the workflow, Gemini AI is used to analyze sentiment and generate summaries, and Google Sheets is used to store the structured results for review and reporting.

Customer Feedback Form

Form description

How satisfied are you with our product or service?

- Very satisfied
- Satisfied
- Neutral
- Unsatisfied
- Very unsatisfied

Please describe your experience or share any feedback in your own words.

Text

Text

Classify the sentiment of this feedback as Positive, Neutral, or Negative. Then summarize it in one sentence.

Answers.How satisfied are you with our product or service? .textAnswers.answers[ ]: value

Answers.Please describe your experience or share any feedback in your own words. .textAnswers.answers[ ]: value

Return your answer in the following exact structure:
{ "sentiment": "[Positive/Neutral/Negative]", "summary": "[Your summary here]" }

Thought Signature

Signature for the thought that can be reused in subsequent requests to preserve reasoning context. For details, see the Google Gemini Thought Signatures guide.

Challenges & improvements

- Ensuring **consistent AI output formatting** required prompt refinement and JSON validation to prevent parsing errors.
- Handling **unstructured free-text feedback** needed careful mapping to ensure the correct data was analyzed.
- Building a fully automated workflow required validating each integration step to avoid manual intervention.

Improvements with More Time or Tools

- Add **trend-level reporting** (weekly or monthly sentiment summaries).
- Integrate **Slack notifications** for faster team response.
- Create **visual dashboards** in Google Sheets for better insight consumption.
- Implement **advanced error handling and retries** to further harden the automation.

Results

The automation successfully processed **multiple real submissions** with a mix of satisfaction levels.

All feedback was automatically analyzed, categorized, and stored without manual intervention.

AI-generated sentiment and summaries were appended to each response in real time.

Sentiment Overview

- **Positive:** Clear praise for usability, support, and overall experience
- **Neutral:** Feedback indicating acceptable performance with limited differentiation
- **Negative:** Clear dissatisfaction related to product issues, unmet expectations, or usability gaps

This allows quick identification of problem areas and prioritization of follow-up actions.

Sample AI-Generated Summaries

- *“The customer found the product easy to use and overall experience positive.”*
- *“The customer felt the product was acceptable but did not stand out.”*
- *“The customer expressed strong dissatisfaction due to product performance issues.”*
